

# A.I. Use Cases

You can use AI in so many interesting ways. Here are some.

## Making Art

Just generate some shit based on some other shit. Fun to do! [Ethical?](#) I dunno.

- Many of the images on this page were generated and/or composited.
- You can use generation tools to doctor and repair images.
- You can use style transfers to apply a look onto another image or video.

## Research

Oh, what rabbit holes you can go down. Start with a question and give us much context as you can / feel comfortable with.

- What spooky things happened at this address? Check public records and cite sources.
- How can I find out if this print is authentic or a mass market production?

## Technical Utility

- All the **spreadsheet** help you could ever dream of, including Apps Script. If it's possible in a spreadsheet, AI usually knows what to do. Gone are the days of hell-searching for help with complicated formulas. You need a pretty good understanding of formulae for this to be good for you, however!

## Code

You can make so many things. Some simple things are one and done. Others can be really extensive and require lots of time, lots of your effort, and lots of tokens. One of my top secret Claude projects has over 140 different GitHub commits over many months.

- Make me a web app that auto-launches a series of URLs that I paste into a field.
- Make me a front-end for YT-DLP that suits my exact use case.
- Make me a Mac OS widget that is a launcher for Zoom links.
- Make me an Audio plug-in that uses UVR within a DAW.
- Make me a Mac OS tool to lock the dock to a specific display.
- Help me make my Bookstack better than it is please.
